

RELIABILITY · DECISION · GOVERNANCE · CONTROL

AEGIS

Reliability, Operational Decision, Governance & Control Platform for Modern Cloud

The intelligent platform that turns fragmented cloud signals into contextual, policy-aware and verifiable operational decisions.

RELIABILITY PLATFORM | GOVERNED AUTONOMY | EVIDENCE-DRIVEN

KNOW → OBSERVE → DECIDE → GOVERN → EXECUTE → VERIFY → LEARN

THE PROBLEM

Modern operations are fragmented

Teams already have cloud platforms, monitoring, observability, automation, IaC and ITSM. The challenge is no longer collecting more data.

Signal noise, no context

Alerts from infrastructure, Kubernetes, applications and security arrive as independent, disconnected streams with no unified situational picture.

Decisions without governance

Operational actions execute without consistent policy checks, authority validation or blast-radius assessment—creating compliance and reliability gaps.

Automation without control

Runbooks and automation tools execute without pre-execution assurance, post-action verification or recovery readiness evaluation.

Knowledge disappears

Critical operational context—what happened, what was tried, what worked—is lost at the end of every incident, repeating the same cycles.

The real challenge is answering: **What is happening? → Why does it matter? → What should happen? → Is the action safe? → Did it work? → What can we learn?**

WHAT IS AEGIS

One operational system

AEGIS is an intelligent **Reliability, Operational Decision, Governance & Control Platform** for modern cloud and cloud-native environments.

It brings together **platform visibility, operational intelligence, decision-making, governance, controlled execution, verification, recovery and continuous learning** within a single operational system.

Operational Control Plane

Acts as the unifying control layer across all cloud platforms, connecting understanding with decision-making and controlled action.

Continuous Operational Loop

KNOW → OBSERVE → DECIDE → CONTROL → EXECUTE → VERIFY → LEARN — a closed lifecycle rather than disconnected processes.

Works Independently or Integrated

Operates standalone or integrates with your existing cloud, Kubernetes, observability, ITSM, CI/CD and IaC ecosystems.

Full Evidence Chain

Every governed operation produces an immutable evidence bundle—from decision context to execution outcome—for audit and accountability.

FOUR CAPABILITY DOMAINS

01 FOUNDATION | 02 OPERATIONS | 03 CONTROL | 04 INTELLIGENCE

© 2026 Brahmora Technologies Private Limited. All rights reserved. · brahmora.co.uk

FOUR DOMAINS

Foundation → Operations → Control → Intelligence

01

Foundation

Know your platform.

- Multi-cloud & Kubernetes discovery
- Resource inventory & dependency graphs
- Configuration drift & structural diffing
- Terraform intent vs. runtime correlation
- Continuous platform baselining

Know what exists, how it connects, what changed.

02

Operations

Run your platform reliably.

- Unified signals & Situation Fusion
- Incident coordination & intelligent triage
- SLO & reliability management
- Change correlation & root-cause context
- Governed runbooks & recovery

Understand what is happening, why it matters, what to do.

03

Control

Govern every decision and action.

- Pre-execution assurance pipeline
- Policy-as-code & reliability gates
- Authority & approval workflows
- Blast-radius & risk assessment
- Post-execution verification + evidence

Ensure every critical action is authorised, safe and evidenced.

04

Intelligence

Continuously improve your platform.

- Operational Memory & pattern learning
- Cost & FinOps intelligence
- Predictive reliability signals
- PRE-100 platform maturity
- Architecture risk intelligence

Turn operational evidence into better decisions and lower risk.

GOVERNED AUTONOMY

Control that scales with confidence

Pre-Execution Assurance

Before any unattended action executes, AEGIS evaluates:

- 🎯 Target identity & ownership
- 📋 Required operational evidence
- 📜 Applicable policy & delegated authority
- 💥 Current blast-radius assessment
- ✅ Verification capability confirmed
- 🔄 Recovery readiness & rollback path
- 🧯 Failure & escalation path defined

> *"Failure to establish a required condition can only* **maintain or reduce autonomy**. *It can never increase it."*

Autonomy is Progressive

AEGIS does not treat autonomy as simply automation on or off. Organisations define precisely what, where, and when actions are permitted.

Autonomy **increases** as policy, evidence, verification and recovery confidence improve — keeping humans in control of the pace.

OPERATIONAL MODEL

From visibility to governed action

Situation Fusion

Connects signals + resources + changes + history into coherent operational situations—not just isolated alerts.

Pre-Execution Assurance

AEGIS does not stop at detecting a problem. It determines whether action is appropriate, permitted and safe.

Verified Remediation

A successful API response is not proof of success. AEGIS verifies resulting state against the intended outcome.

Operational Memory

Previous operational experience contributes to future decisions—knowledge is preserved, not lost.

INTEGRATIONS

Works independently. Integrates everywhere.

AEGIS creates a unified operational model from multiple sources. It brings telemetry, infrastructure state, changes, workflows and execution capabilities into one common decision and control framework.

ARCHITECTURE INTELLIGENCE

Intent	What Terraform config says should exist
Managed	What Terraform currently believes it manages
Runtime	What actually exists in the cloud environment

CLOUD PLATFORMS

AWS · Azure · GCP · Kubernetes

OBSERVABILITY

Datadog · Prometheus · Grafana · New Relic · OpenTelemetry

ITSM & WORKFLOW

ServiceNow · Jira · Webhooks · Email

INFRASTRUCTURE & DELIVERY

Terraform · CI/CD · IaC · Security findings · Cost signals

All sources are correlated into a **common operational model** — providing unified context for every decision, action and verification step.

ONE PLATFORM. DIFFERENT PERSPECTIVES.

Purpose-built for the teams that design, run and govern the cloud

Platform Engineers

"Is the platform healthy and operating as designed?"

Maintain shared platforms, detect divergence early, and automate repetitive operations without losing engineering control.

DevOps Engineers

"Can we deliver this change safely?"

Connect CI/CD, deployments, infrastructure changes and runtime behaviour. Understand if a change contributed to an issue.

Site Reliability Engineers

"Can we maintain reliability and recover quickly?"

Focus on SLOs, error budgets, failure patterns and recovery. Distinguish individual symptoms from wider operational situations.

Security Engineers

"Is this risk controlled and safely remediated?"

Move from detecting misconfigurations to safely correcting them with governed, verified remediation workflows.

Incident Management

"What is happening and how do we recover?"

Transform disconnected alerts into coherent operational situations with shared impact tracking and escalation paths.

FinOps Teams

"Where can we reduce cost without creating risk?"

Evaluate optimisation opportunities alongside workload importance, utilisation, operational risk and policy.

Architecture & Leadership

"Are we operationally ready to proceed?"

Compare architectural intent with runtime reality. Use operational evidence instead of manually assembled status reports.

Executives

"What is our technology risk and posture?"

Business-level view of technology reliability, operational risk, governance, resilience and improvement trends.

WHY AEGIS

Beyond cloud-native tooling

CAPABILITY	TYPICAL CLOUD-NATIVE TOOLS	AEGIS
Cloud scope	Primarily provider-specific	✓ Cross-cloud & platform
Situation correlation	Varies by service	✓ Cross-domain Situation Fusion
Pre-execution assurance	Service/control-specific	✓ Integrated assurance pipeline
Policy governance	Provider-specific	✓ Cross-platform governance
Autonomy boundaries	Tool-specific	✓ Explicit authority & safety boundaries
Post-action verification	Workflow-dependent	✓ Closed-loop verification
Operational memory	Distributed & siloed	✓ Unified decision & outcome history
Evidence chain	Distributed	✓ Decision-to-outcome evidence chain

THE OUTCOME

From reactive to governed, evidence-driven operations

Reduce Operational Risk

Policy, authority, blast-radius and recovery readiness evaluated before every critical action—preventing unsafe changes before they impact production.

Resolve Incidents Faster

Correlate infrastructure, Kubernetes, application, security and deployment signals into actionable situations with full dependency context.

Automate with Confidence

Enable operational automation within explicit policies, authority and safety boundaries. Increase autonomy progressively as confidence is earned.

Accountable Automation

Preserve immutable evidence explaining why every action was permitted, what was executed and what outcome was achieved—for audit and compliance.

Preserve Operational Knowledge

Operational Memory captures every incident, decision and outcome. Context no longer disappears when an incident ends.

Improve Reliability

Combine SLOs, incidents, dependencies, changes and history to support safer decisions and continuously improve platform maturity.

Know what is happening and why

Decide with evidence, not instinct

Govern every action before it runs

Learn from every operation

AEGIS — From operational visibility to governed action. **Operate faster. Reduce risk. Automate with confidence. Prove every decision.**
